application:

**Listing of Claims**:

Claims 1-13. (Canceled)

14. (Currently amended) A primary element for an electrical machine, comprising

a magnetically conductive body assembly assembled from laminations resting axially

on one another and having a plurality of axially extending teeth disposed in a star pattern,

a winding of individual annular coils which are wound separately as coil-body-less air

coils and thrust radially onto the teeth,

a compensation element on at least one face end of the magnetically conductive body,

the compensation element being elastically deformable in the axial direction of the tooth and

being placed onto each of the face ends, located in a transverse plane to the body axis, of the

teeth, and the annular coil which is thrust onto the tooth being pressed axially onto the at least

one compensation element; and

a closed ring element joining all the compensation elements together to make a

compensation mask.

15. (Previously presented) The primary element as defined by claim 14, wherein one

compensation mask is provided on each face end of the magnetically conductive body.

16. (Previously presented) The primary element as defined by claim 14, further comprising

parallel ribs embodied on the outer face, facing away from the tooth, of the compensation

elements, the ribs being disposed one above the other and spaced apart from one another in the

radial direction of the tooth.

17. (Previously presented) The primary element as defined by claim 15, further comprising

parallel ribs embodied on the outer face, facing away from the tooth, of the compensation

elements, the ribs being disposed one above the other and spaced apart from one another in the

radial direction of the tooth.

18. (Previously presented) The primary element as defined by claim 14, wherein the

compensation element has the shape of a U with a transverse strut embodied in gable-like

fashion and two short legs of the U integrally extending from the transverse strut; and wherein

the transverse strut covers the face end of the tooth, and the legs of the U reach over the long

sides, facing away from one another, of the tooth.

19. (Previously presented) The primary element as defined by claim 15, wherein the

compensation element has the shape of a U with a transverse strut embodied in gable-like

fashion and two short legs of the U integrally extending from the transverse strut; and wherein

the transverse strut covers the face end of the tooth, and the legs of the U reach over the long

sides, facing away from one another, of the tooth.

20. (Previously presented) The primary element as defined by claim 16, wherein the

compensation element has the shape of a U with a transverse strut embodied in gable-like

fashion and two short legs of the U integrally extending from the transverse strut; and wherein

the transverse strut covers the face end of the tooth, and the legs of the U reach over the long

sides, facing away from one another, of the tooth.

21. (Previously presented) The primary element as defined by claim 18, wherein the ribs are

shaped in one piece from the gable-like transverse strut.

22. (Previously presented) The primary element as defined by claim 18, wherein the gable-like

transverse strut is embodied such that between the gable faces and the face end of the tooth, a

spring travel is present for resilient retraction of the transverse strut.

23. (Previously presented) The primary element as defined by claim 21, wherein the gable-like

transverse strut is embodied such that between the gable faces and the face end of the tooth, a

spring travel is present for resilient retraction of the transverse strut.

24. (Previously presented) The primary element as defined by claim 14, wherein the ring

element is formed by a preferably thin-walled annular sleeve, from whose outer wall the

compensation elements protrude in a star pattern.

25. (Previously presented) The primary element as defined by claim 24, wherein the annular

sleeve comprises a protruding portion, which protrudes axially past the transverse struts of the

compensation elements and which, when annular coils have been placed on the teeth, covers the

undersides of the coil heads of the annular coils.

26. (Previously presented) The primary element as defined by claim 24, wherein the annular

sleeve and the compensation elements are made in one piece as a plastic injection-molded part.

27. (Previously presented) The primary element as defined by claim 25, wherein the annular

sleeve and the compensation elements are made in one piece as a plastic injection-molded part.

28. (Previously presented) The primary element as defined by claim 14, further comprising

one insulation strip each resting on the one hand between the long sides, facing away from one

another, of the teeth and on the other between the inner long sides, oriented toward the

aforementioned long sides, of the annular coils pressed onto the teeth.

29. (Previously presented) The primary element as defined by claim 15, further comprising

one insulation strip each resting on the one hand between the long sides, facing away from one

another, of the teeth and on the other between the inner long sides, oriented toward the

aforementioned long sides, of the annular coils pressed onto the teeth.

30. (Previously presented) The primary element as defined by claim 16, further comprising

one insulation strip each resting on the one hand between the long sides, facing away from one

another, of the teeth and on the other between the inner long sides, oriented toward the

aforementioned long sides, of the annular coils pressed onto the teeth.

31. (Previously presented) The primary element as defined by claim 28, wherein one

insulation strip is secured, preferably glued on, to each of the inner long sides, oriented toward

one another, of the annular coils.

32. (Previously presented) The primary element as defined by claim 28, wherein the insulation

strips are angled, on the top side pointing outward of the annular coils, for the sake of covering

these annular coils.

33. (Previously presented) The primary element as defined by claim 14, wherein the

magnetically conductive body comprises a hollow-cylindrical short-circuit yoke, which is

slipped onto the outward-pointing, free tooth faces of the teeth equipped with the annular coils.
